At more than 200 acres, the Botanical Garden of the Juiz de Fora Federal University is considered one of the largest urban forest fragments in Brazil. It was acquired by the university in 2010, with a view to integrating biodiversity conservation, environmental and scientific education, and public engagement. The vegetation in this fragment originally formed part of the Atlantic Rain Forest biome, with a highly diverse and heterogeneous tree community and a number of species that are threatened with extinction. Today it harbors a large number of pioneer plants (sun-loving plants that spring up after forests are cut down) as well as exotic (non-native) plants. It is also home to 20 orders, 46 families, and 156 species of birds, including two endangered species and six new records for the region
